Printing line with UV oven

One color printing machine	UV oven with cooling system	Stacker

This is the one of solutions for you to use UV oven,

In this way, you can do the base coating first for the sheet, then go through the UV oven, then stacking,

If there is only one color, then the sheet can go to the varnish process, if over two colors, then go through the printing machine again and again, then go to varnish process. In this way, you can save the energy, more printing you are running, more cost you are saving.

Here is the process:
1. Base coating by the conventional line,
2. Printing colors by the UV oven line,
3. Varnish process

Then now you only need to buy the UV oven, we suggest the second hand UV oven, you can save cost at the beginning.
